

Slash Your Energy Bills with Superior Replacement Windows

It's time to start thinking about winterizing your windows and doors as the cold weather approaches. Energy efficient window treatments, coverings and even replacement windows can lower your heat consumption, utility costs and make your home or business premises more comfortable. Without properly insulated windows and frames, your building is susceptible to cold drafts, which will cause your furnace to work twice as hard to heat your indoor environment. If your windows are old, cracked, always moist or foggy and beyond repair, think about installing new [replacement windows](#) to conserve energy and save money.

Inspecting your exterior and interior windows will help you determine whether or not they need to be replaced. Before installing new replacement windows, practice these simple and affordable insulation techniques, which can dramatically reduce your home's heating and cooling expenses:

- Check for cracks and drafty areas around your windows and doors, and seal with a high quality caulking compound.
- Weather-stripping your doors will stop cold air from spilling into your home.
- If your window is cracked, it should be replaced and frames should be primed and painted.
- Window screens block radiated heat from entering the home, so store them away for the winter.
- Remember to keep your windows clean, so you can benefit from the most sunlight.
- Protect your windows and doors with frames that are less susceptible to extreme temperatures.
- Storm windows have an extra layer of protection and guard against wind and condensation, so have these professionally installed.

Call Dallas Energy Efficient Products at 972-398-6105 for energy efficient replacement windows that can save you money.

Improve Interior Comfort with Highly Insulated Replacement Windows

If you've tried insulating and sealing exposed entry points but still find that your windows are leaking air, it may be time for replacement windows. The combination of [energy efficient windows](#) and coverings can provide you with home energy savings for several years to come.

When selecting window coverings for your replacement windows, consider the following:

- Window treatments that effectively minimize heat loss in the winter and prevent the cold air from escaping your home in the summer
- Insulated coverings that completely stop heat loss in the cooler months
- Solar window coverings that absorb and shade radiated heat in the warmer months

Dallas Energy Efficient Products can professionally install your replacement windows quickly and without any disruption to your routine. Not only will our products significantly reduce heat loss, but they will also protect your new windows from solar heat in the sizzling hot summer months, so you can reduce your cooling expenses too.
